LEGAL REPRESENTATIVE:

...SPECIFICATION prohibitive for poor patients.
Other attempts to monitor patients remotely have included the use of medical monitoring devices with built-in modems. Examples of such **monitoring** devices include **blood glucose** meters, respiratory flow meters, and heart rate **monitors**. Unfortunately, these **monitoring** devices are only designed to collect physiological data from the patients. They do not allow flexible and dynamic querying of the patients for other information...

...poor patients. Further, it is difficult to identify each patient uniquely using these systems. Moreover, these systems are generally incapable of collecting medical data from **monitoring** devices, such as **blood glucose** meters, respiratory flow meters, or heart rate **monitors**.

Remote monitoring of drug delivery

In recent years, the value of keeping electronic medical records in place of paper records has been widely recognized in the health...
...and patient monitoring apparatus that may be easily operated and carried by a user. A further object of the invention is to provide a patient **monitoring** and drug delivery measurement apparatus suited to **diabetic** patients, and to diabetes home care in particular. It is yet another object to provide an apparatus facilitating automated paperless data processing, from measurements performed...condition of the patient and for generating condition data representative of the physical or physiological condition. The recording device records the condition data. Preferably, the **monitoring** or testing device is a **blood glucose** meter and the physical or physiological condition is the patient's blood glucose level. A display connected to the measuring device is used to display...

...transmit the measurements to the patient's remotely programmable apparatus 26a-x, e.g., through a standard connection cable 30. Examples of suitable types of **monitoring** devices include **blood glucose** meters, respiratory flow meters, blood pressure cuffs, electronic weight scales, and pulse rate monitors. Such monitoring devices are well known in the art. The specific...data input device.
Three monitoring device jacks 68A, 68B, and 68C are located on a surface of housing 62. The device jacks are for connecting **remotely** programmable apparatus 26a to a number of **monitoring** devices, such as **blood glucose** meters, respiratory flow meters, or blood

pressure cuffs, through respective connection cables (not shown). Apparatus 26a also includes a modem jack 66 for connecting apparatus...

...may be used.
Device interface 90 is connected to device jacks 68A, 68B, and 68C. Device interface 90 is for interfacing with a number of **monitoring** devices, such as **blood glucose** meters, respiratory flow meters, blood pressure cuffs, weight scales, or pulse rate monitors, through device jacks 68A-C. Device interface 90 operates under the control...

...94 has corresponding response choice fields 96 for entering response choices for the query. Screen 56 further includes check boxes 98 for selecting a desired **monitoring** device from which to collect measurements, such as a **blood glucose** meter, respiratory flow meter, or blood pressure cuff.
Screen 56 additionally includes a connection time field 100 for specifying a prescribed connection time at which...

...specifies the selected monitoring device 28a-x from which to collect the measurements. In step 314, microprocessor 76 prompts the patient to connect a selected **monitoring** device 28a-x, for example a **blood glucose** meter, to one of device jacks 68A-C. A sample prompt is shown in Fig. 9. In step 316, microprocessor 76...18 through communication network 24, as described hereinabove, for transmitting measurement data from measurement apparatus, e.g., 428a-x, to workstation 20. Examples of suitable **monitoring** devices include **blood glucose** meters, respiratory flow meters, blood pressure cuffs, electronic weight scales, and pulse rate monitors. Examples of measurements of a patient's treatment include measurements of...

...444 tests a physical or physiological condition of the patient, and generates condition data representative of the physical or physiological condition. Preferably, the condition is **diabetes**, the **monitoring** device includes a **blood glucose** meter, and the condition data includes a blood glucose level of the patient. Recording device 440 records the condition data generated by monitoring device 444...

...IDREF= F0017> Fig. 20B) is also coupled to housing 550. In a preferred embodiment, the patient places a finger on patient interface 558, allowing **monitoring** device 444 to perform a **blood glucose** measurement for the patient. Blood glucose meters are well known in the art and will not be discussed here in detail. A dose measurement control...

INVENTOR:
BROWN, **Stephen**, James...
LEGAL REPRESENTATIVE:

...SPECIFICATION calls for rather frequent monitoring and a relatively high degree of patient participation. For example, in order to establish and maintain a regimen for successful **diabetes** care, a diabetic should **monitor** his or her **blood glucose** level and record that information along with the date and time at which the **monitoring** took place. Since diet, exercise, and medication all affect **blood glucose** levels, a diabetic often must record data relating to those items of information along with **blood** glucose level so that the **diabetic** may more closely **monitor** his or her condition and, in addition, can provide information of value to the healthcare provider in determining both progress of the patient and detecting...

...about significant changes in medical diagnostic and monitoring equipment, including arrangements for self-care monitoring of various chronic conditions. With respect to the control and **monitoring** of **diabetes**, relatively inexpensive and relatively easy-to-use **blood glucose monitoring** systems have become available that provide reliable information that allows a **diabetic** and his or her healthcare professional to establish, **monitor** and adjust a treatment plan (diet, exercise, and medication). More specifically, microprocessor-based **blood glucose monitoring** systems are being marketed which sense the glucose level of a blood sample that is applied to a reagent-impregnated region of a test strip that is inserted in the glucose **monitor**. When the **monitoring** sequence is complete, the **blood glucose** level is displayed by, for example, a liquid crystal display (LCD) unit.

Typically, currently available self-care **blood glucose monitoring** units include a calendar/clock circuit and a memory circuit that allows a number of blood glucose test results to be stored along with the date and time at which the **monitoring** occurred. The stored test results (**blood glucose** level and associated time and date) can be sequentially recalled for review by the **blood glucose monitor** user or a health professional by sequentially actuating a push button or other control provided on the **monitor**. In some commercially available devices, the average of the **blood glucose** results that are stored in the **monitor** (or the average of the results for a predetermined period of time, e.g., fourteen days) also is displayed during the recall sequence. Further, some self-care **blood glucose monitors** allow the user to tag the test result with an "event code" that can be used to organize the test results into categories. For example...

...readings taken during hypoglycemia symptoms and hyperglycemia symptoms, etc. When event codes are provided and used, the event code typically is displayed with each recalled **blood glucose** test result.

Microprocessor-based **blood glucose monitoring** systems have advantages other than the capability of obtaining reliable **blood glucose** test results and storing a number of the results for later recall and review. By using low power microprocessor and memory circuits and powering the units with small, high capacity batteries (e.g., a single alkaline battery), extremely compact and light designs have been achieved that allow taking the **blood glucose monitoring** system to work, school, or anywhere else

the user might go with people encountered by the user not becoming aware

Detailed Description
... poor patients.

3 0
Other attempts to monitor patients remotely have included the use of medical monitoring devices with built-in modems. Examples of such **monitoring** devices include **blood glucose** meters, respiratory flow meters, and heart rate **monitors**. Unfortunately, these **monitoring** devices are only designed to collect physiological data from the patients.

They do not allow flexible and dynamic querying of the patients for other information...

...Further, it is difficult to identify each patient uniquely using these systems. Moreover, these systems are generally incapable of 2 5 collecting medical data from **monitoring** devices, such as **blood glucose** meters, respiratory flow meters, or heart rate **monitors**.

Remote monitoring of dru2 delivery
In recent years, the value of keeping electronic medical records in place of paper records 3 0 has been widely recognized in...monitoring apparatus that may be easily 2 5 operated and carried by a user. A further object of the invention is to provide a patient **monitoring** and drug delivery measurement apparatus suited to **diabetic** patients, and to diabetes home care in particular. It is yet another object to provide an apparatus facilitating automated paperless data processing, from measurements performed... condition of the patient and for generating condition data representative of the physical or physiological condition. The recording device records the condition data. Preferably, the **monitoring** or testing device is a **blood glucose** 2 5 meter and the physical or physiological condition is the patient's blood glucose level. A display connected to the measuring device is used ...measurements to the patient's 3 0 remotely programmable apparatus 26a-x, e.g., through a standard connection cable 30.

Examples of suitable types of **monitoring** devices include **blood glucose** meters, respiratory flow meters, blood pressure cuffs, electronic weight scales, and pulse rate monitors. Such monitoring devices are well known in the art. The specific...

...input device.

- 22 Three monitoring device jacks 68A, 68B. and 68C are located on a surface of housing 62.

The device jacks are for connecting **remotely** prograintriable apparatus 26a to a number of **monitoring** devices, such as **blood glucose** meters, respiratory flow meters, or blood pressure cuffs, through respective connection cables (not shown). Apparatus 26a also includes a modem jack 66 for connecting apparatus... may be used.

Device interface 90 is connected to device jacks 68A, 68B, and 68C. Device interface 90 is for interfacing with a number of **monitoring** devices, such as **blood glucose** meters, respiratory flow meters, blood pressure cuffs, weight scales, or pulse rate monitors, through device jacks 68A-C. Device interface 90 operates under the control...

...has corresponding response choice fields 96 for entering response
choices for the query. Screen 56 further includes check boxes 98 - 24 for
selecting a desired **monitoring** device from which to
collect measurements, such as a **blood**
glucose meter, respiratory flow meter, or blood
pressure cuff.

Detailed Description

Detailed Description
... treatment plan
also limits the ability of a healthcare provider to aid the
patient in treating his or her disease. Many treatment plans
require daily **monitoring** of a physiological condition
of the
patient, such as **blood glucose**
concentration in diabetes, peak
flow rates in asthma, and blood pressure in hypertension. Since

the patients themselves monitor their conditions in outpatient programs, the healthcare...communication means, such as a telephone network or the Internet.

The apparatus also contains device jacks to connect the apparatus to a printer and a **monitoring** device, such as a **blood glucose** meter.

In another embodiment, the computerized reward system comprises a interactive telephone call, whereby the individual is asked and answers compliance questions over the telephone...and transmit the measurements to remote apparatus 48 through a standard connection means 52. The measurements can be used as compliance data. Examples of suitable **monitoring** devices include **blood glucose** meters, respiratory flow meters, blood pressure cuffs, electronic weight scales, and pulse rate monitors.

Such monitoring devices are well known in the art. The specific...any other data input device.

A monitoring device jack 94 is located on a surface of housing 48.

Monitoring device jack 94 is for connecting **remote** apparatus 48 to a number of **monitoring** devices, such as **blood glucose** meters, respiratory flow meters, or blood pressure cuffs, through respective connection cables (not shown) Remote apparatus 48 also includes a modem jack 96 for connecting...modems, etc. may also be used. Device interface 108 is connected to device jack 94. Device interface 108 is for interfacing with a number of **monitoring** devices, such as **blood glucose** meters , respiratory f low meters , blood pressure cuffs, weight scales, or pulse rate monitors, through device jack 94. Device interface 108 operates under the control...program 60 specifies selected monitoring device 50 from which to collect device measurements 64.

In step 414, processor 98 prompts the individual to connect selected **monitoring** device 50, for example a **blood glucose** meter, to device jack 94. A sample prompt is shown in Fig. 9. In step 416, processor 98 waits until a reply to the prompt...to view. Educational program 202 ideally corresponds with the compliance questions and the monitoring device 50. For example, if the compliance questions are aimed at **diabetic**

individuals and **monitoring** device 50 is a
blood glucose meter,
educational program 202 will be on diabetes.

In addition, plan specification screen 205 also displays
is evaluation criteria. Each evaluation criterion has a check...
determines the selected
monitoring device 50 from which to collect device measurements 64.

In step 524, multimedia processor 196 prompts the individual to
connect selected **monitoring** device 50, for example a
blood glucose
meter, to device jack 94. In step 526, multimedia processor 196
collects device measurements 64 from monitoring device 50 through
device interface 108. Device measurements...204 determines the selected
monitoring device 50
from which to collect device measurements 64. In step 524, server
42 prompts the individual to connect selected
monitoring device
50, for example a **blood glucose**
meter, to a device jack of DTMF
telephone 246 via communication link 248. Device measurements 64
are stored in database 58.

Next is step 626...monitoring device 50 from which to
collect device measurements 64. In step 704, customized health
management script program 60 prompts the individual to connect
selected **monitoring** device 50, for example a
blood glucose meter,
to a device jack 94 of multimedia processor 197. Device
measurements 64 are stored in database 58 on workstation 45 in
step 706.

Detailed Description
... calls for rather frequent monitoring and a relatively high degree of patient participation. For example, in order to establish and maintain a regimen for successful **diabetes** care, a diabetic should **monitor** his or her **blood glucose** level and record that information along with the date and time at which the **monitoring** took place. Since diet, exercise, and medication all affect **blood glucose** levels, a diabetic often must record data relating to those items of information along with **blood** glucose level so that the **diabetic** may more closely **monitor** his or her condition and, in addition, can provide information ...about significant changes in medical diagnostic and monitoring equipment, including arrangements for self-care monitoring of various chronic conditions. With respect to the control and **monitoring** of **diabetes**, relatively inexpensive and relatively easy-touse **blood glucose monitoring** systems have become available that provide reliable information that allows a **diabetic** and his or her healthcare professional to establish, **monitor** and adjust a treatment plan (diet, exercise, and medication). More specifically, microprocessor-based **blood glucose monitoring** systems are being marketed which sense the glucose level of a blood sample that is applied to a reagentimpregnated region of a test strip that is inserted

in the glucose **monitor**. When the
monitoring sequence is complete, the
blood glucose level is displayed
by, for example, a liquid crystal display (LCD) unit.

Typically, currently available self-care **blood**
glucose monitoring units include a
calendar/clock circuit and a memory circuit that allows a number of blood
glucose test results to be stored along with the date and time at which
the **monitoring** occurred. The stored test results (
blood glucose level and associated
time and date) can be sequentially recalled for review by the
blood glucose
monitor user or a health professional by sequentially
actuating a push button or other control provided on the
monitor. In some commercially available devices, the
average of the **blood glucose**
results that are stored in the **monitor** (or the average
of the results for a predetermined period of time, e.g., fourteen days)
also is displayed during the recall sequence.

Further, some self-care **blood**
glucose monitors allow the user to
tag the test ...readings taken during hypoglycemia symptoms and
hyperglycemia symptoms, etc. When event codes are provided and used, the
event code typically is displayed with each recalled
blood glucose test result.

Microprocessor-based **blood glucose**
monitoring systems have advantages
other than the capability of obtaining reliable **blood**
glucose test results and storing a number of the
results for later recall and review. By using low power microprocessor
and memory circuits and powering the units with small, high capacity
batteries (e.g., a single alkaline battery), extremely compact and light
designs have been achieved that allow taking the **blood**
glucose monitoring system to work,
school, or anywhere else the user might go with people encountered by the
user not becoming aware of the **monitoring** system. In
addition, most microprocessor-based self-care **blood**
glucose monitoring systems have a
memory capacity that allows ...to be programmed by the manufacturer so
that the monitor displays a sequence of instructions during any necessary
calibration or system tests and during the **blood**
glucose test sequence itself In addition, the system
monitors various system conditions during a
blood glucose test (e.g., whether a
test strip is properly inserted in the monitor and whether a sufficient
amount of blood has been applied to the the memory of the
microprocessorbased **blood glucose**
monitoring system to be transferred to a data port
(e.g., RS-232 connection) of a personal computer or other such device for
subsequent analysis.

Detailed Description

Detailed Description
... invention. Figure 3 shows a tongue-based electrotactile input of the present invention configured to provide video information. Such a system finds use in transferring **video** information to blind or vision-impaired subjects or to enhance or supplement the perception of sighted subjects. The configuration of the device shown comprises two... detected compound or agent, the amount, nature of, and/or location may also be perceived by the subject. Such sensors may also be used to **monitor** biological systems. For example, **diabetic** subjects can use the system associated with a glucose sensor (e.g., implanted blood or saliva-based glucose sensor) to "see" or "feel" their **blood glucose** levels. Athletes can **monitor** ketone body formation. Organ transplant patients can monitor and feel the presence of cytokines associated with chronic rejection in time to seek the appropriate medical ...
